

## *Presentation d'une PME*

# *Genewave: multiplex, point-of-care diagnostics*

Claude Weisbuch,  
Fondateur et Directeur scientifique

aussi

DR CNRS (émérite, labo PMC, Ecole Polytechnique)  
Professeur, Materials department, UCSB

Kickoff meeting NanoSaclay  
28 novembre 2011

# Genewave geneSpress platform

- Molecular diagnostics based on nucleic acid testing
- Lab-on-chip disposable cartridges
  - On-chip purification, amplification, hybridization, detection
- High multiplex capability (20-50+)
- < 3-hour turnaround time

# Importance of infectious disease diagnostics

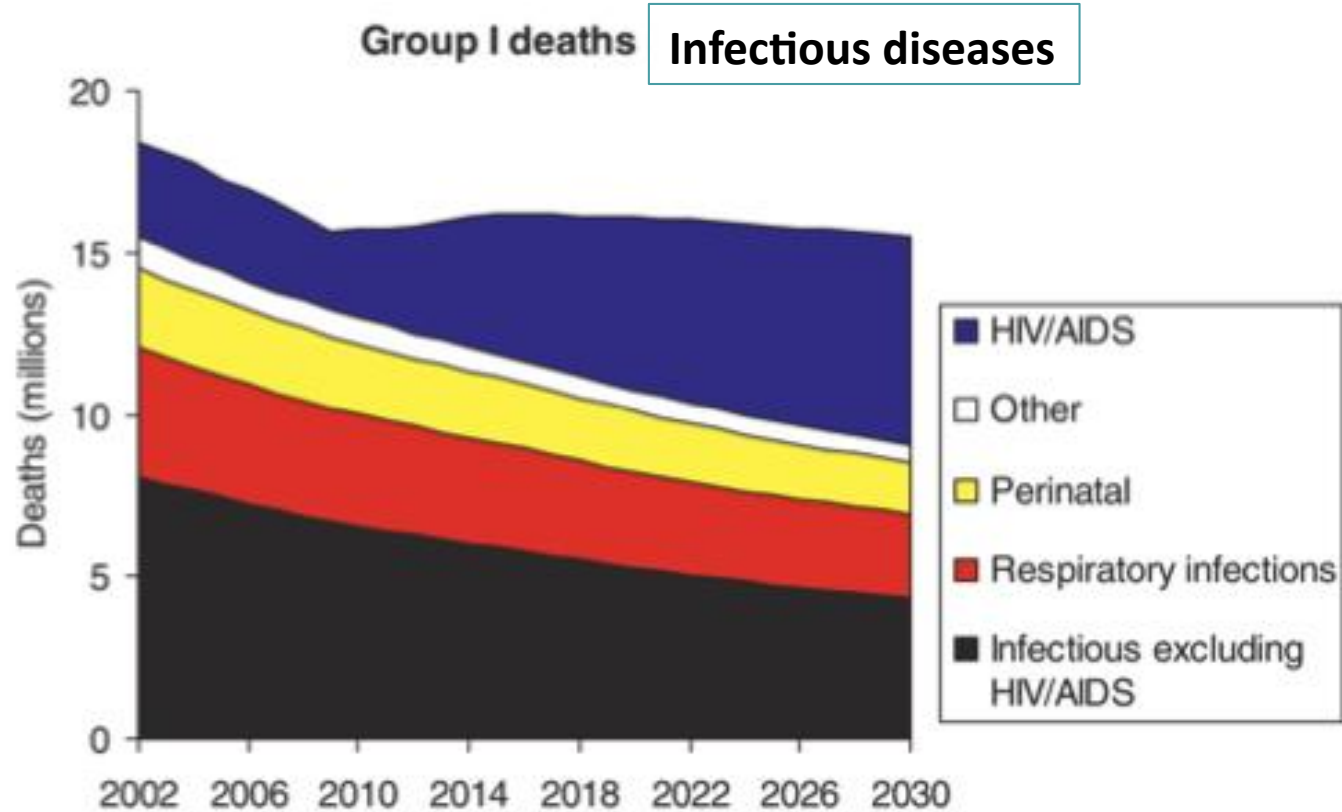

## Projections of Global Mortality of Disease from 2002 to 2030

PLoS Medicine | [www.plosmedicine.org](http://www.plosmedicine.org)

Colin D. Mathers\*, Dejan Loncar

Evidence and Information for Policy Cluster, World Health Organization, Geneva, Switzerland

Long term decrease due to better diagnostics, better and wider treatments

# Maladies infectieuses : des besoins non satisfaits

- Un diagnostic précis nécessite de cribler un large panel de pathogènes potentiels; les symptômes à plusieurs types d'infections, et il faut identifier le bon traitement  
(i.e. donner l'antibiotique spécifique au lieu de donner à l'aveugle un cocktail d'antibiotiques ce qui contribue à développer de nouvelles souches résistantes.
  
- Les technologies actuelles fournissent :
  - Un crible large avec des tests longs:
    - *e.g.*, ~15-plex pour les virus respiratoires
  - Des tests rapides à couverture réduite:
    - *e.g.*, ~2-plex pour MRSA/SA
  
- Besoin: des tests diagnostics rapides, très sensibles, couvrant un large panel (> 6 marqueurs)

# Tests multiplexes rapides

L'identification des gènes des bactéries ou virus indique la souche infectieuse, c.a.d. la maladie, et permet d'identifier la meilleure médication

Donne aussi des indications sur la résistance possible de la souche et permet ainsi de prescrire l'antibiotique spécifique pour la souche.

- ➔ Tests respiratoires (nécessitent 10-40+-plex)
  - Virus respiratoires
  - Pneumonies associées à la ventilation mécanique (PAVM)
  - Pneumonies communautaires
- ➔ Résistance aux antibiotiques(30-40)
- ➔ Septicémie (40+)

→ Société privée focalisée sur le développement et la commercialisation de solutions technologiques innovantes pour le diagnostic moléculaire basé sur la reconnaissance de séquences d'acides nucléiques caractéristiques des infections

→ Fondateurs:

Claude Weisbuch

- Directeur de Recherches, Ecole Polytechnique
- Professeur, University of California, Santa Barbara

Henri Benisty

- Professeur, Institut d'Optique IOGS

→ 22 employés

→ Située à Paris et à Evry

# Genewave at a glance (business)

## Business Model

Development of an Automated, Fast Multiplex Molecular Diagnostics system: GeneSpress™ and associated kits that will be:

- ➔ Sold to Hospital Laboratories
- ➔ 100% In-House Manufactured (Cost Control)
- ➔ Promoted by Direct Sales and Distributors

## Structure

Two business sites:

- Paris: R&D, Admin, R&D&M (750 m<sup>2</sup>)
- Evry: Manufacturing (350 m<sup>2</sup>)

➔ Workforce: 22 people, mostly engineers and PhDs in various disciplines (Molecular Biology, Physics, Chemistry, Engineering)

➔ Several prestigious partners: Pasteur Institute, Paris Hospitals, Ecole Polytechnique, CNRS, CEA, Génopôle, Curie Institute, University of Bonn, GE-Whatman, DKFZ, University of Lausanne, University of Geneva, ...

## Milestones and pipeline

- ➔ Q2 2011: GeneSpress® Proof of Concept.
- ➔ Q3 2012: GeneVAP™ Market Authorization
- ➔ Q1 2014: GeneScreen™ Market Authorization

# ! *Panorama Genewave*

- Ingénieurs stricto sensu : 7
  - généralistes, chimie, optique, mécanique, électronique
- Universitaires assimilés ingé (bio): 2 (PhDs+postdocs)
- Techs bio : 4
- PhD : 9 (physique, chimie, bio, informatique)
- Expérience internationale : 8 (6 PhD + 2 ingé)
- Boite à dominante R&D (phase start up) → beaucoup de PhD aux postes à responsabilité (4 managers sur 7, 3 chefs de projet sur 4)

Entreprise encore plus pluridisciplinaire que d'habitude (tout projet industriel l'est) par le sujet mélangeant ingénierie, physique, chimie, biologie, médical, ...

Un défi majeur: définir un langage commun pour travailler et progresser ensemble.

# Principe des biopuces

Analyse rapide et à haut débit de biomolécules (parallélisme)

Plusieurs domaines d'applications:

- Génétique
- Pharmaceutique
- alerte bioterrorisme

Ensemble de sondes connues liées à un substrat

(ADN, peptides, anticorps)

Interaction avec les espèces biologiques cibles inconnues dans un échantillon

Puces à ADN

Sondes  
Séquence complémentaire de celle de la cible visée

cibles

Couche de fonctionnalisation

substrat

immobilisation

Visualisation, et identification de milliers de cibles

From Larbi Touahir

# Origine de l'idée sous-jacente de Genewave: What happens in a standard confocal scanner? (i.e. Genepix)

L'essentiel de la lumière est capturée dans le substrat. Même avec une grande ouverture, seule 10-20% de la lumière est récupérée. L'intensité incidente est aussi diminuée (à 64%) juste sur la surface par interférence destructive avec le faisceau excitateur réfléchi

# Resultat: AmpliSlide™ Technology

## Glass Substrate

*A large part of the fluorescence escapes in the glass substrate*

## AmpliSlide™

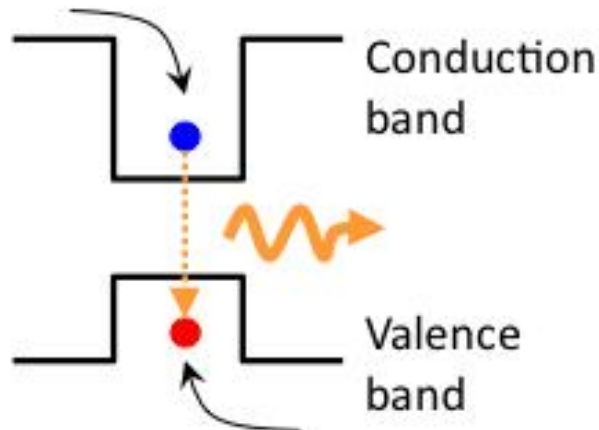

*Thanks to the thin film coating, fluorescence is amplified to enhance sensitivity. There is less background fluorescence from the glass substrate.*

- Challenges:
- uniformity/reproducibility physical properties
  - uniformity/reproducibility chemical properties (competition between Signal and background)

*D'ou sont venues nos idées? De nos travaux sur l'extraction de lumière dans les diodes émettrices de lumière*

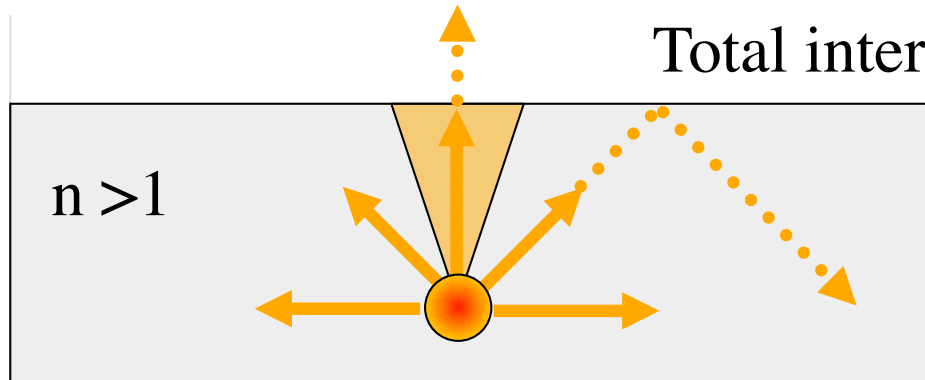

## 101. Light Emitting Diodes

Gallium Nitride (InGaN)  
LED

*Our background: Microcavity and photonic crystal LEDs: The basic idea*  
*Usually light remains in the LED due to total internal reflexion*

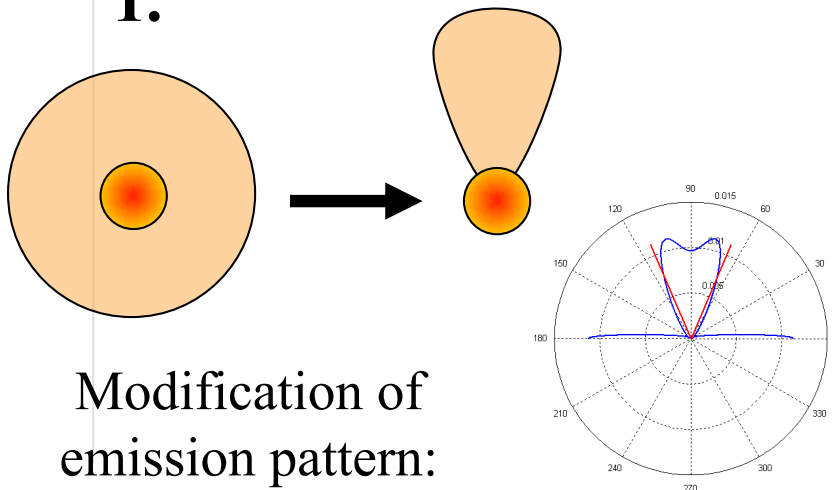

## Total internal reflexion

~ 6 % of light extracted  
~ 94 % trapped in high-index material

- Geometrical solutions...such as mirrors
- Use the wave nature of light

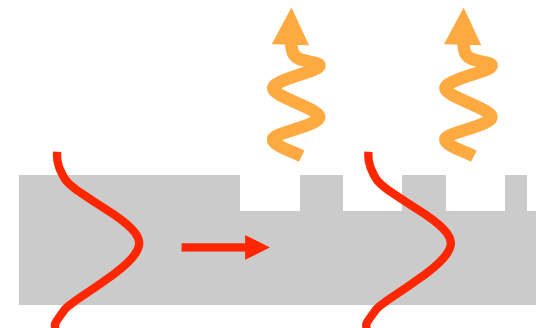

1.

Modification of emission pattern:  
**MCLEDS**

Maximum 40%

2.

Diffraction of trapped light:  
**Photonic Crystals**

Aim at 80%+ efficiency

# Our solutions: Improving fluorescence efficiency

1. amplifying slides  
Interferences

2 Direct  
imaging

3. evanescent wave excitation  
and direct imaging

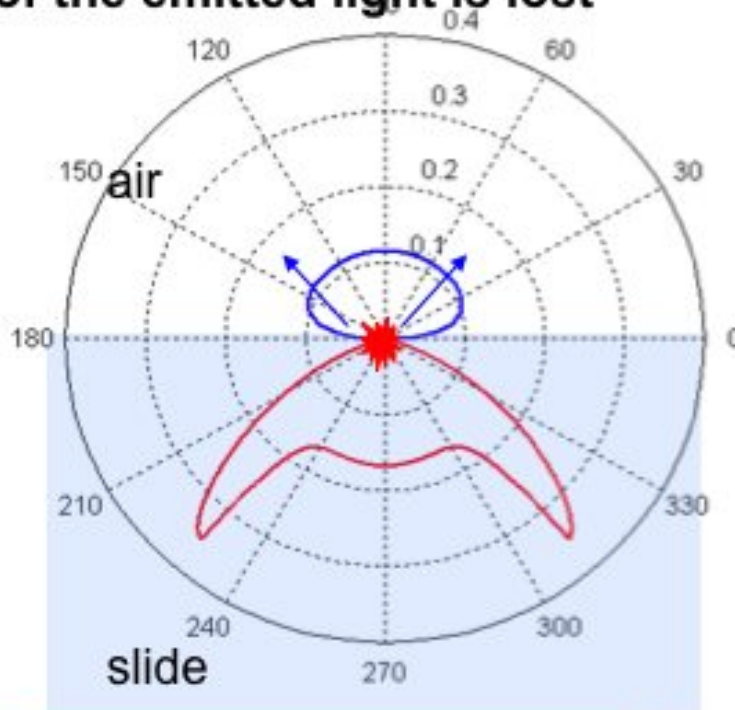

# Comparing emission on Glass or AmpliSlide™ substrate

## → Glass slide:

Fluorescence escapes to the glass substrate and does not enter into the collection optics:

**Most of the emitted light is lost**

Low collection efficiency

## → AmpliSlide™:

**Fluorescence is advantageously redirected and enhanced** upward to the collection optics

High collection efficiency

# AmpliSlide

## Fluorescence amplifying slides

- Up to **30 fold signal fluorescence amplification**
- **Fully compatible** with commercial equipment (spotters, hybridizers and scanners) and microarray surface chemistries

### Benefits:

#### **More signal and/or more sensitivity to:**

- Lower detection threshold
- See low expressed genes
- Explore new research fields
- Use less biological material
- Reduce the Costs
- Enhance quality and reliability
- Reduce Scanning duration

# Hyblive™

## Integrated hybridization chamber & real-time reader

### Amplifying slides

- Allow good collection at small aperture
- can image large field
- allows real time imaging of many spots
- allows real time measurement of hybridization

### Benefits:

- Develop a better understanding of DNA binding to spot
- Access to hybridization kinetics
- High - quality data and error estimates

# I instrumentation scientifique: la station d'hybridation en temps réel : HybLive™

- Lames de format standard
- Fenêtre de 1 cm<sup>2</sup> (2000 spots)
- Chambre d'hybridation de 70 µl (mm<sup>3</sup>)

- Station d'hybridation, de lavage et lecteur de fluorescence intégré
- Système intégré de mixage
- Contrôle de température (20-70°C)
- 3 bouteilles de lavage + 1 bouteille d'eau
- Résolution de 10 µm
- Jusqu'à 3 images par minute
- Logiciels de contrôle et d'analyse

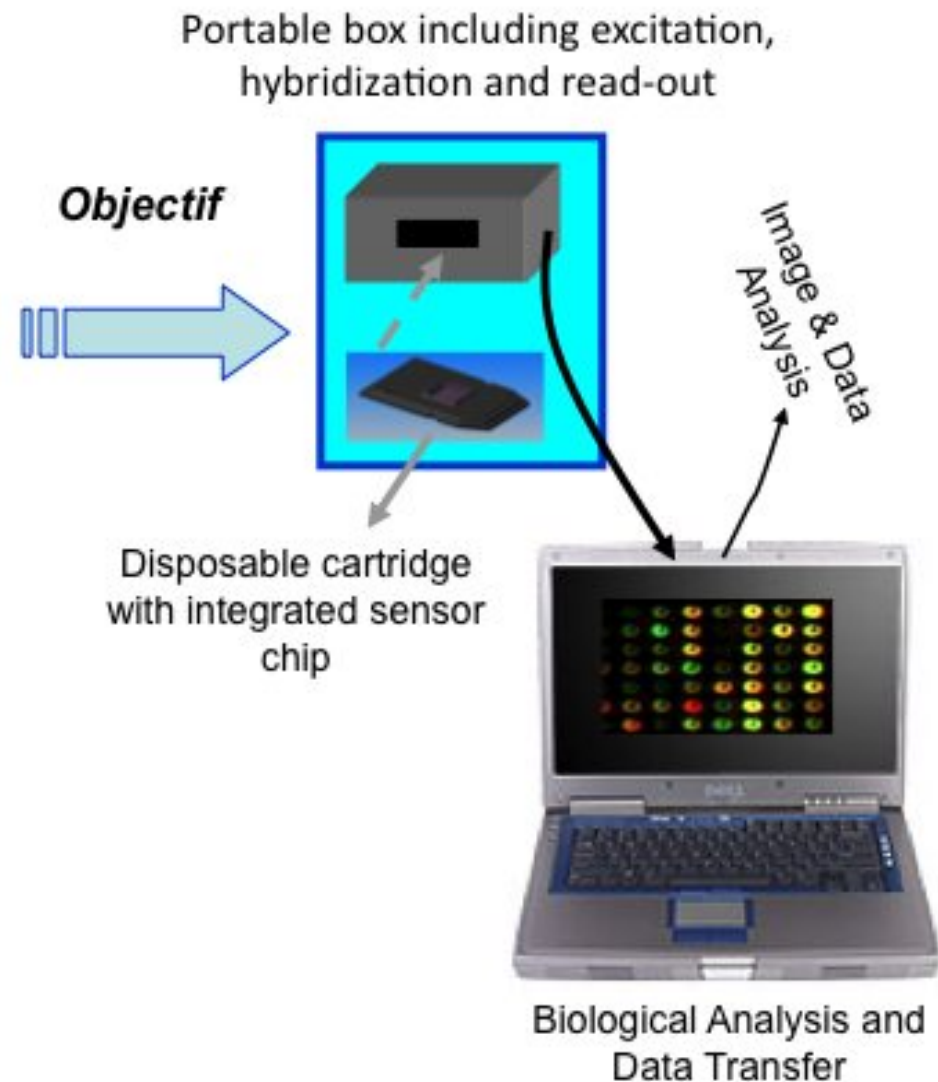

# *Solution sans optique la vision du biocapteur silicium intégré*

## Applications

- Field Analysis
- Pathogens Identification
- Analysis Automation
- Diagnosis kit development
- Lab-On-a-Chip

# Biocapteur silicium intégré: imagerie par contact

Integration on a CCD Imager

*Miniaturization (about 20x)*

*Sensitivity enhancement (about 30x)*

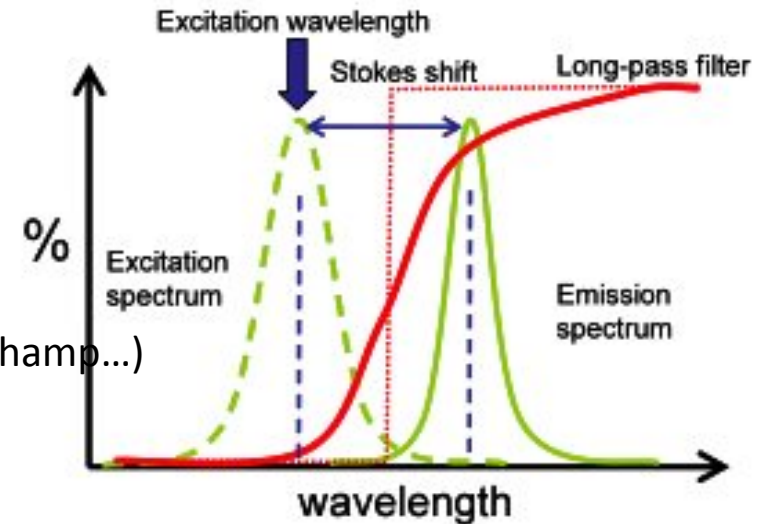

Demand on high rejection filter:

- High rejection
  - Low excitation transmission
  - High fluorescence transmission
- Omnidirectional (not interference)
- Low intrinsic fluorescence
- Low fabrication temperature

# ▮ *Filtere absorbant*

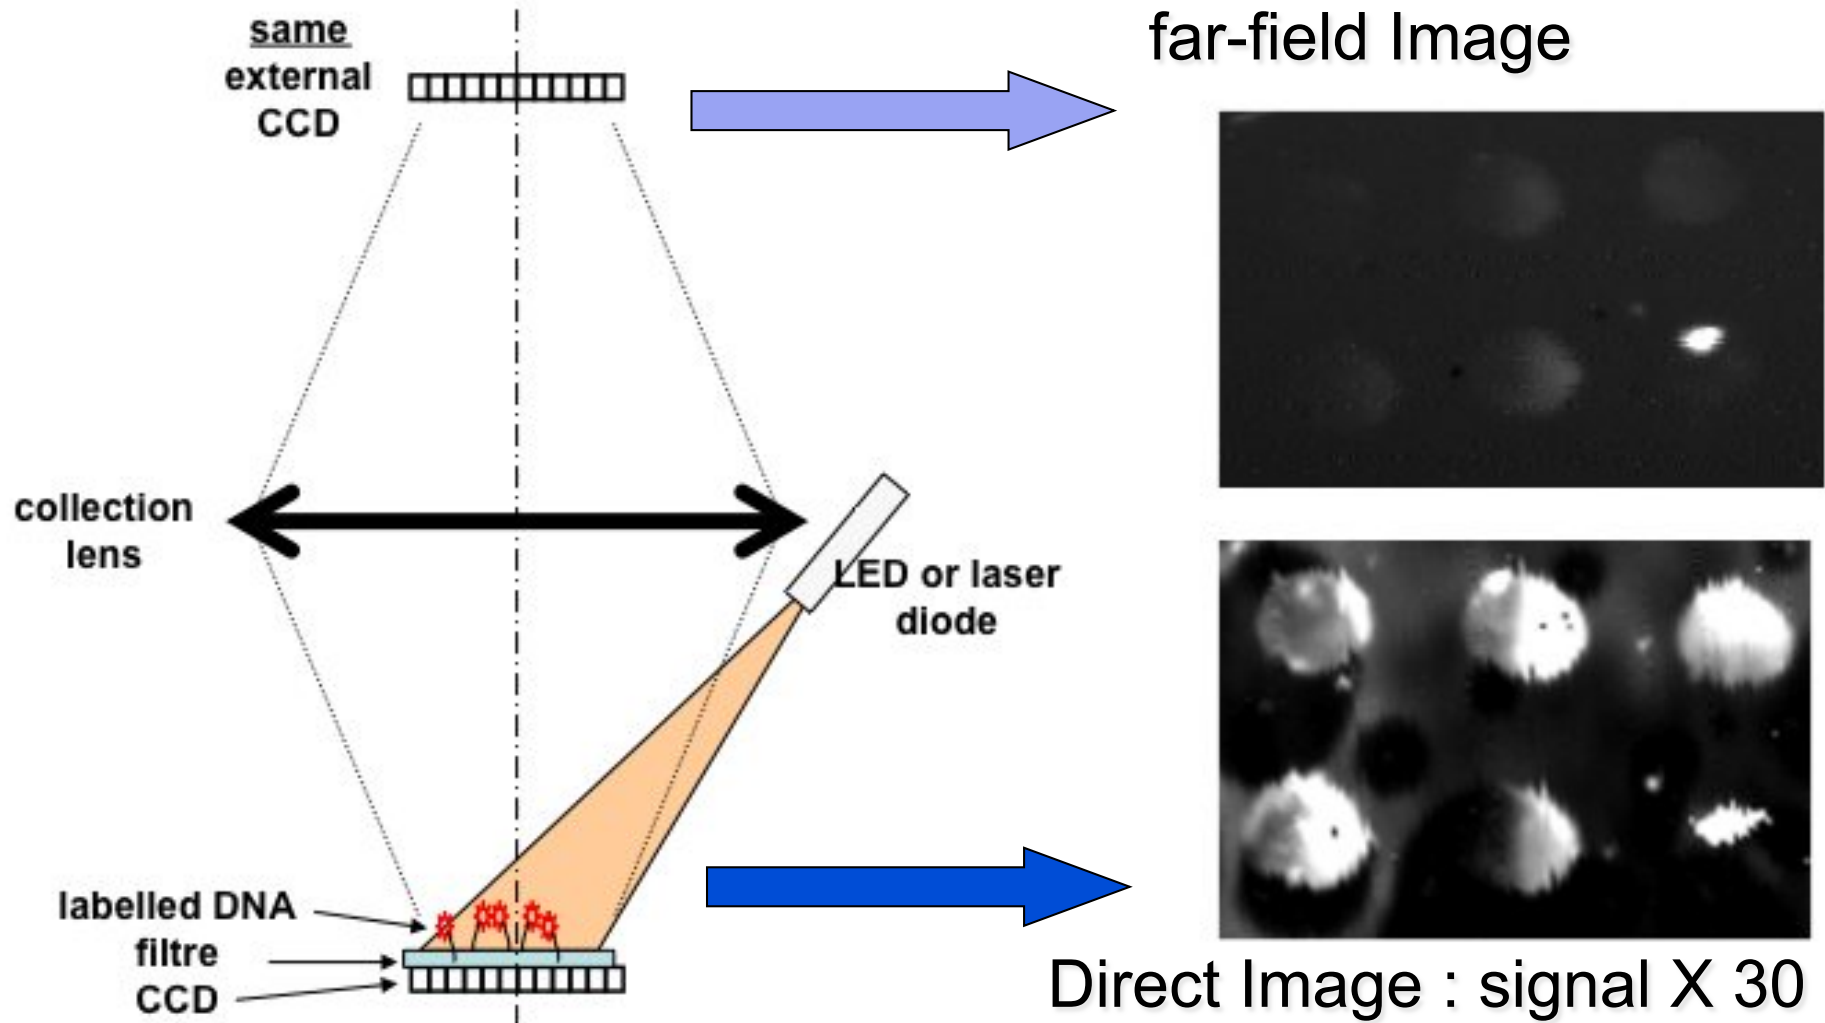

- ➔ Spec sur la réjection excitation / émission
  - $R > 10^7$
- ➔ Imageur grand champ
  - Filtre interférentiel
    - $R > 10^5$  (faisceau parallèle... angle de champ...)
  - Géométrie champ sombre
    - $R \sim 10^3$
- ➔ Filtre absorbant
  - $R > 10^{7+}$  (plus mesurable au spectrophotomètre)
- ➔ Imposé des contraintes sur le choix du fluorophore

1cm

# Integrated Silicon Biosensor performance: observation des memes spots par imagerie lointaine ou par contact

Polyimide layer doped with a chromium-based dye  
 $t \approx 6 \mu\text{m}$ , dye concentration  $\approx 50\%$  polymer volume solution  
 $T \approx 10^{-6}$  at  $\lambda_{\text{exc}}$  and a 60% transmission at  $\lambda_{\text{emi}}$

*Smaller is better!*

# Sensitivity limit: impact of the high collection efficiency

$$I = 5 \text{ mW/cm}^2$$

Excitation photon flux  $\sim 10^{16} \text{ ph cm}^{-2}\text{s}^{-1}$

Pixel surface  $10 \times 10 \mu\text{m} = 10^{-6} \text{ cm}^2$

Background = rejection \* ph  $10^{10} \text{ s}^{-1}/\text{pixel}$

(for **rejection =  $10^{-6}$** , **bkg =  $10^4 \text{ ph s}^{-1}/\text{pixel}$** )

Effective section (Qdots)  $\sim 10^{-14} \text{ cm}^2$

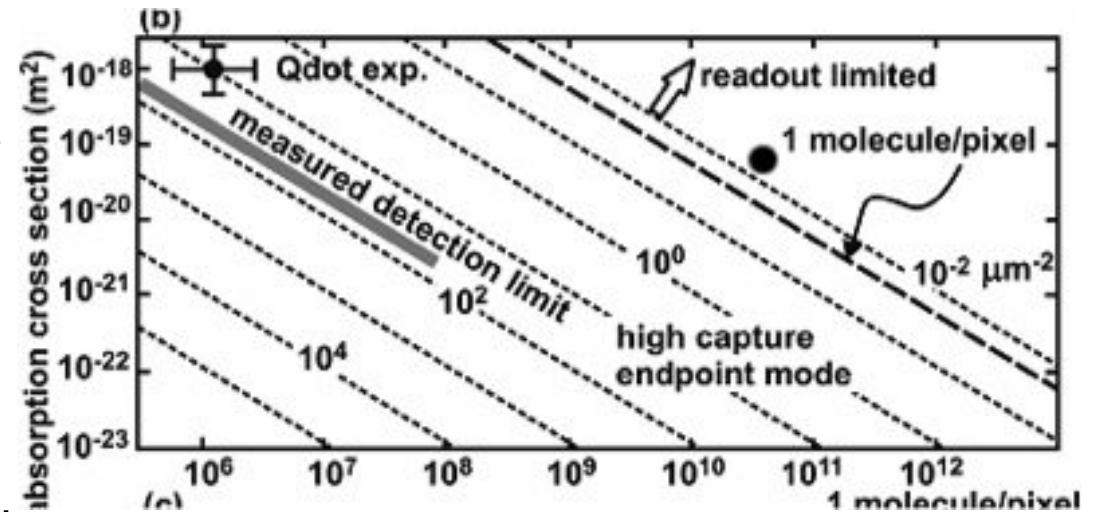

Quantum efficiency (Qdots)  $\sim 10\%$

Emission per fluorophore  $\sim 10 \text{ ph s}^{-1}$

For 10 fluorophore/  $\mu\text{m}^2$ , per pixel

Emission per  $10 \times 100$  (area)  $\sim 10^4 \text{ ph s}^{-1}/\text{pixel}$

For 10 fluorophore/  $\mu\text{m}^2$  sensitivity  
rejection must be  $10^6$

**Intrinsic detector noise does not set the limit**

**Multiple single molecule detection level can be reached in low-cost imaging system**

# GeneSpress® Platform

## Why it works

GeneSpress®  
Cartridge

- Simple cartridge design
- On-chip valves
- Direct sample loading
- Robust Assay Design methodology

The core of compact technology:  
The GeneSpress®  
Docking station

- Valve actuation / Reagents transfer
- Fast and efficient Cycling
- Unique TouchArray fluorescence detection technology
- Expert Analysis Software

# Flu microarrays H1N1 detection on Real Time system

controls spots

# Limit of detection: Biosensor DNA analysis

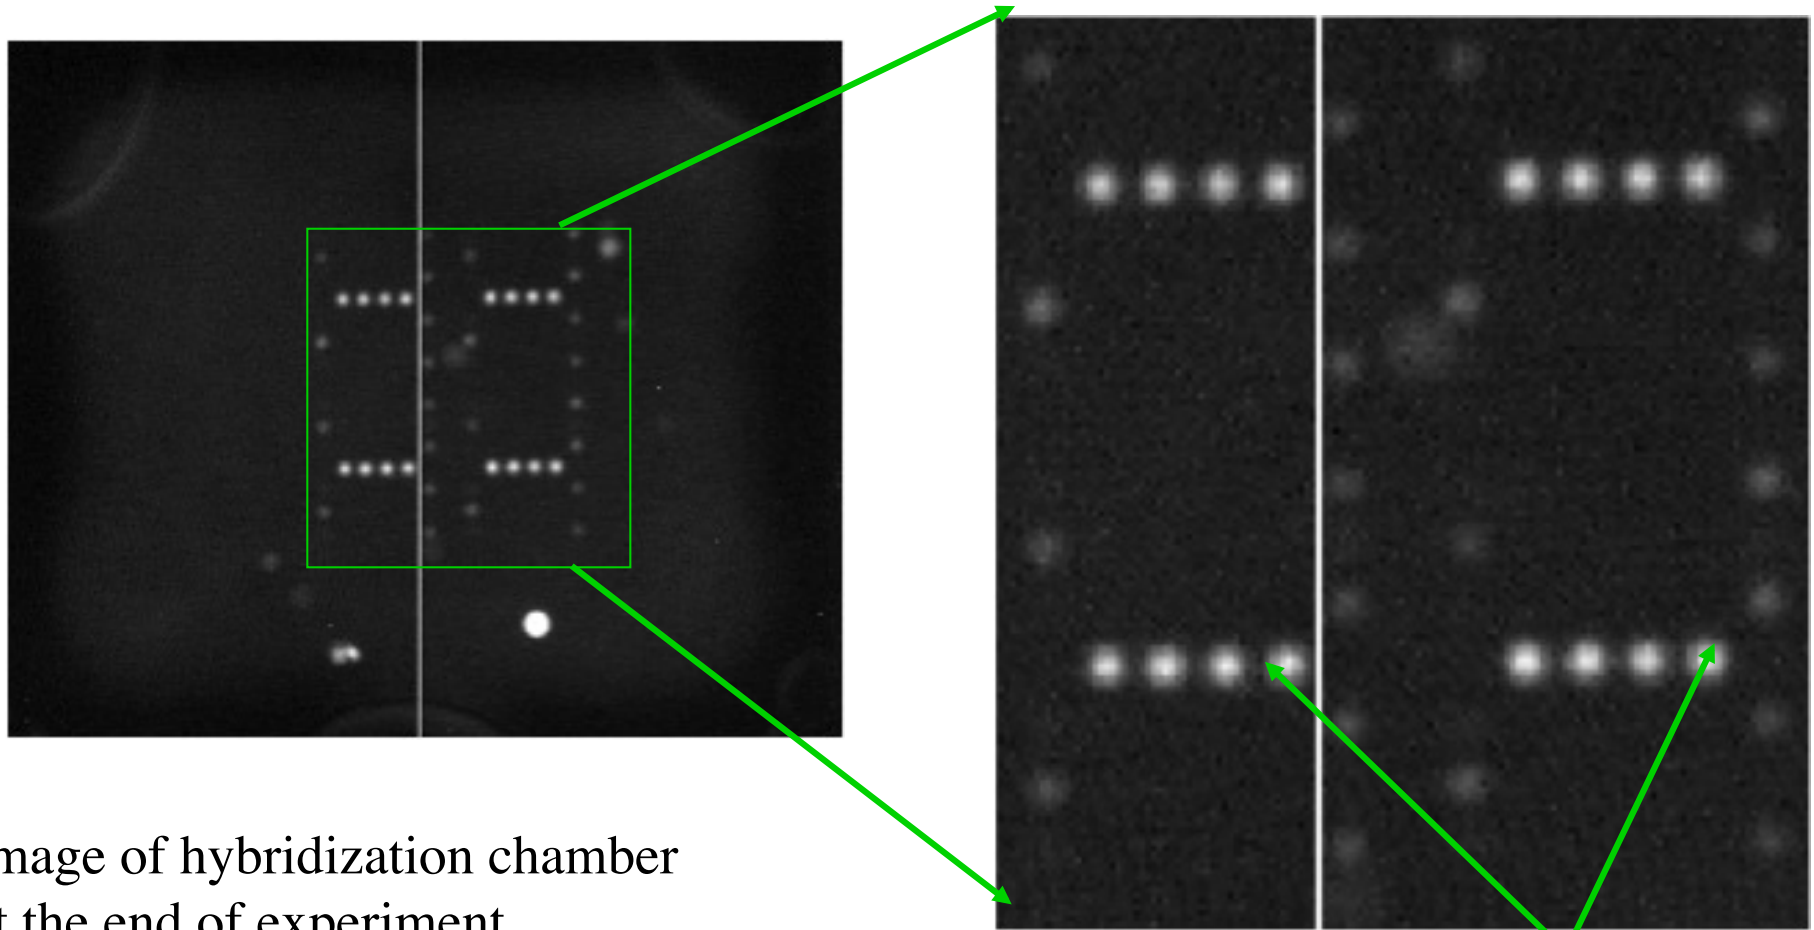

Image of hybridization chamber  
at the end of experiment

controls

Hybridization of RT-PCR non purified target (biotinylated)  
Starting material:  $10^{-7}$  dilution of viral RNA (100 copies)  
Detected by integrated biosensor (SNR = 7,5)

# GeneSpress® Platform: : Diagnostics Decision call by Expert software (DiagES)

- Statistical determination of the on/off state of each probe, based on replicates analysis
- Result and interpretation of the analysis is given via a truth table

The screenshot displays the GeneSpress software interface. At the top, the 'GeneSpress result' field shows 'Flu A positive, Subtype pandemic H1'. Below this, a green bar indicates 'Assay validity'. The interface is divided into three columns: 'Targeted markers', 'Probes', and 'Controls'. The 'Targeted markers' column lists MA, MB, Seasonal H1, Swine pandemic H1, and H3. The 'Probes' column shows results for MA (YES), MB (NO), H1S (NO), H1V (YES), and H3 (NO). The 'Controls' column shows results for empty (YES), Ng1 (YES), Ng2 (YES), CTRL Rev (YES), CTRL Hyb (YES), and MS2 (YES).

Targeted markers	Probes	Controls
MA	MA YES	empty YES
MB	MB NO	Ng1 YES
Seasonal H1	H1S NO	Ng2 YES
Swine pandemic H1	H1V YES	CTRL Rev YES
H3	H3 NO	CTRL Hyb YES
		MS2 YES

# *The GeneSpress platform: the control and analysis software*

Welcome window and user choice

# *The GeneSpress platform: the control and analysis software*

## User's instructions

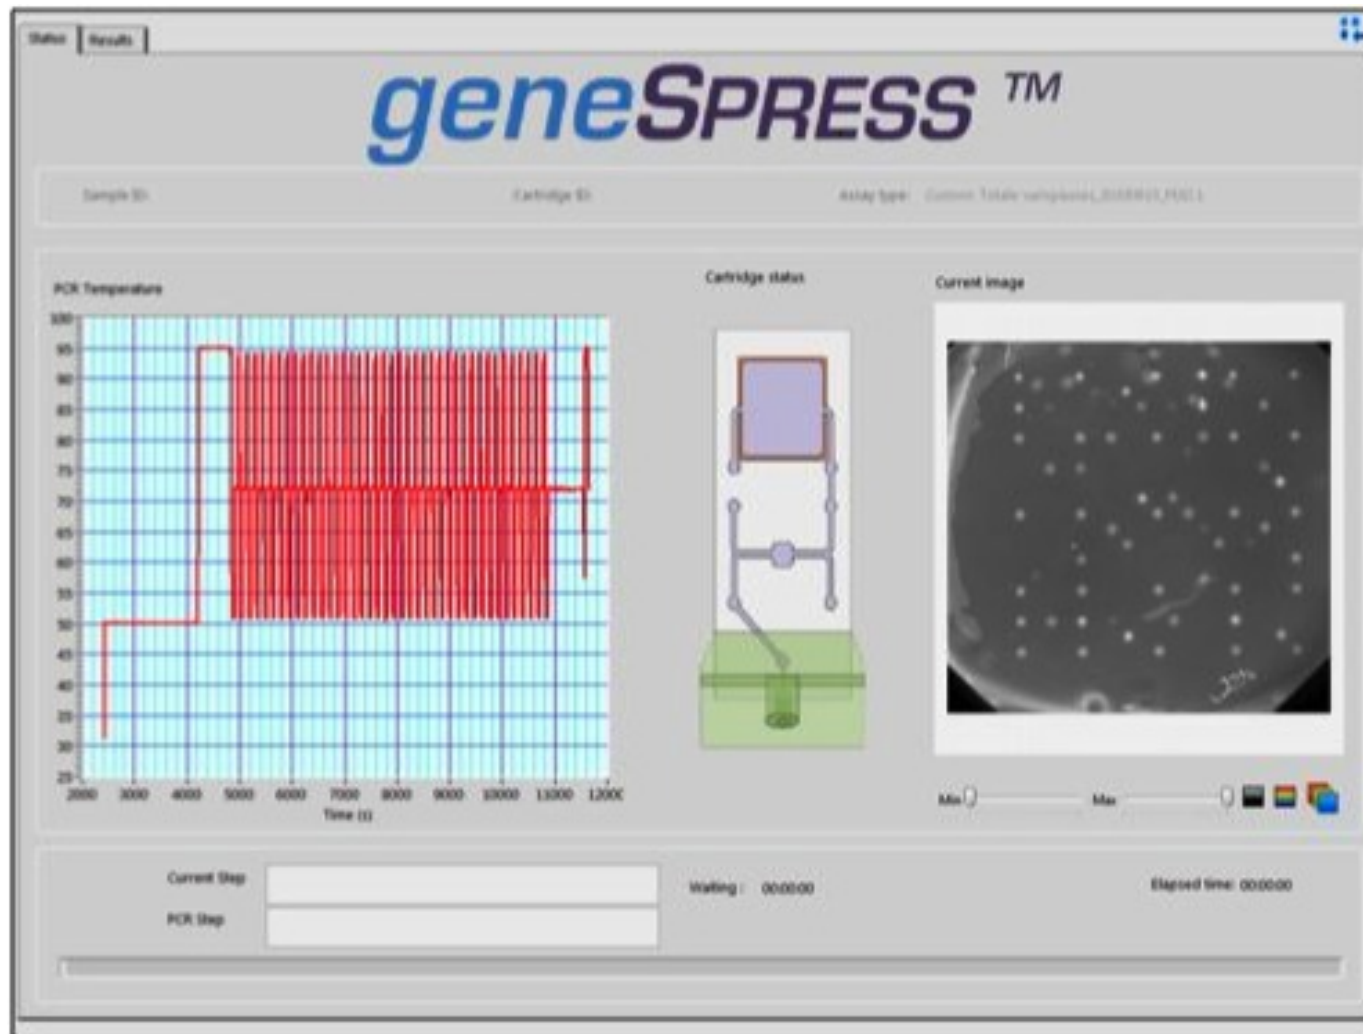

The screenshot displays the GeneSpress software interface. At the top left is the **genewave** logo. On the top right, there are icons for **Maintenance** (a water drop) and **Exit** (a power button). Below the header, a **Main** tab is active, and the text **RC1b** with a small icon is visible in the top right corner. The main content area is titled **Assay preparation** and contains a list of instructions:

- 1- Open Reader door
- 2- Insert PCR reagent vial
- 3- Insert cartridge

Below the list, it says **>>> Click GO when ready**. To the right of the text is a 3D illustration of the GeneSpress instrument with a purple lid. Two black arrows point to the reagent vial and cartridge insertion slots. At the bottom left, there is a **Previous** button with a left-pointing arrow. At the bottom right, there is a **Go!** button with a right-pointing arrow.

# ■ The GeneSpress platform: the control and analysis software

Real time monitoring of process steps

# The GeneSpress platform: the control and analysis software

Display of analysis results

The screenshot displays the GeneSpress software interface. At the top, the 'geneWAVE' logo is on the left, and navigation icons for 'Protocol Mode', 'Run Mode', 'Maintenance', and 'Exit' are on the right. Below this is a menu bar with 'Main', 'Amplification', 'Detection', and 'Results' (the active tab). The 'Results' tab shows sample information: 'Sample ID' (blank), 'Assay type' (Custom), 'Cartridge ID' (blank), and 'Date' (10/06/21). There are 'Export gpr' and 'Results screenshot' buttons. Below the menu bar are tabs for 'Summary', 'Details - Probes', and 'Details - Controls'. The 'Summary' tab is active, showing an 'Assay result' text box with the text 'Infection par un virus de la famille MA, sous-type H1p'. Below this are three sections: 'Probes', 'Controls', and 'Degree of confidence'. The 'Probes' section lists MA (YES), MB (NO), H1s (NO), H1p-e (YES), H1p-k (NO), and H3 (NO). The 'Controls' section lists vide (YES), Ng1 (YES), Ng2 (YES), CTRL Rev (YES), and CTRL Hyb (YES). The 'Degree of confidence' section shows a green progress bar. A 'Tested genes' list on the right includes MA, MB, H1 saisonnier, H1 pandémique, and H3.

Probes	Result
MA	YES
MB	NO
H1s	NO
H1p-e	YES
H1p-k	NO
H3	NO

Controls	Result
vide	YES
Ng1	YES
Ng2	YES
CTRL Rev	YES
CTRL Hyb	YES

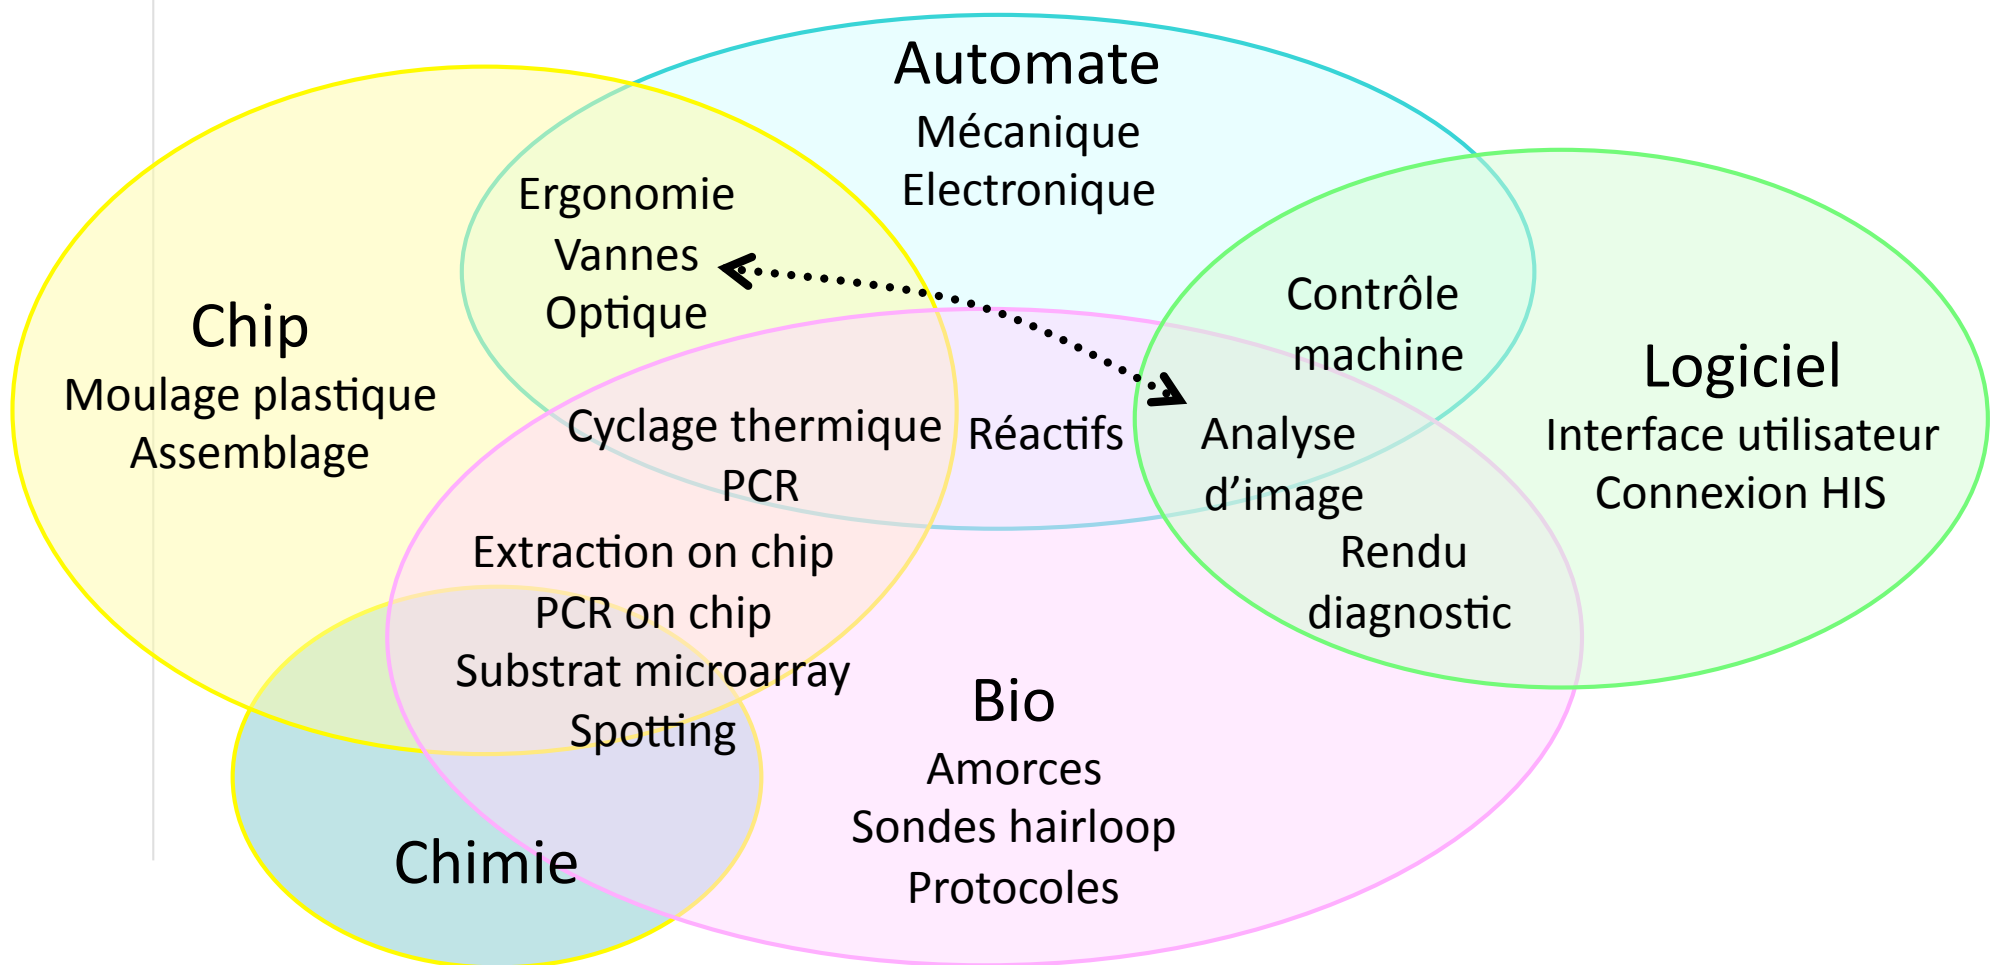

Degree of confidence: [Green bar]

Tested genes: MA, MB, H1 saisonnier, H1 pandémique, H3

# Technologies Genewave

La réalisation d'un tel outil n'est possible que par l'intégration de nombreuses technologies, portées par des spécialistes, travaillant dans une organisation ayant une autorité légitime et efficace, la start up.

## Messages

Une bonne idée en physique => une start up?

Il faut la d'abord transformer l'idée en produit, \$\$\$\$ , santé publique : course de haies avec beaucoup de haies, il faut TOUTES LES SAUTER!

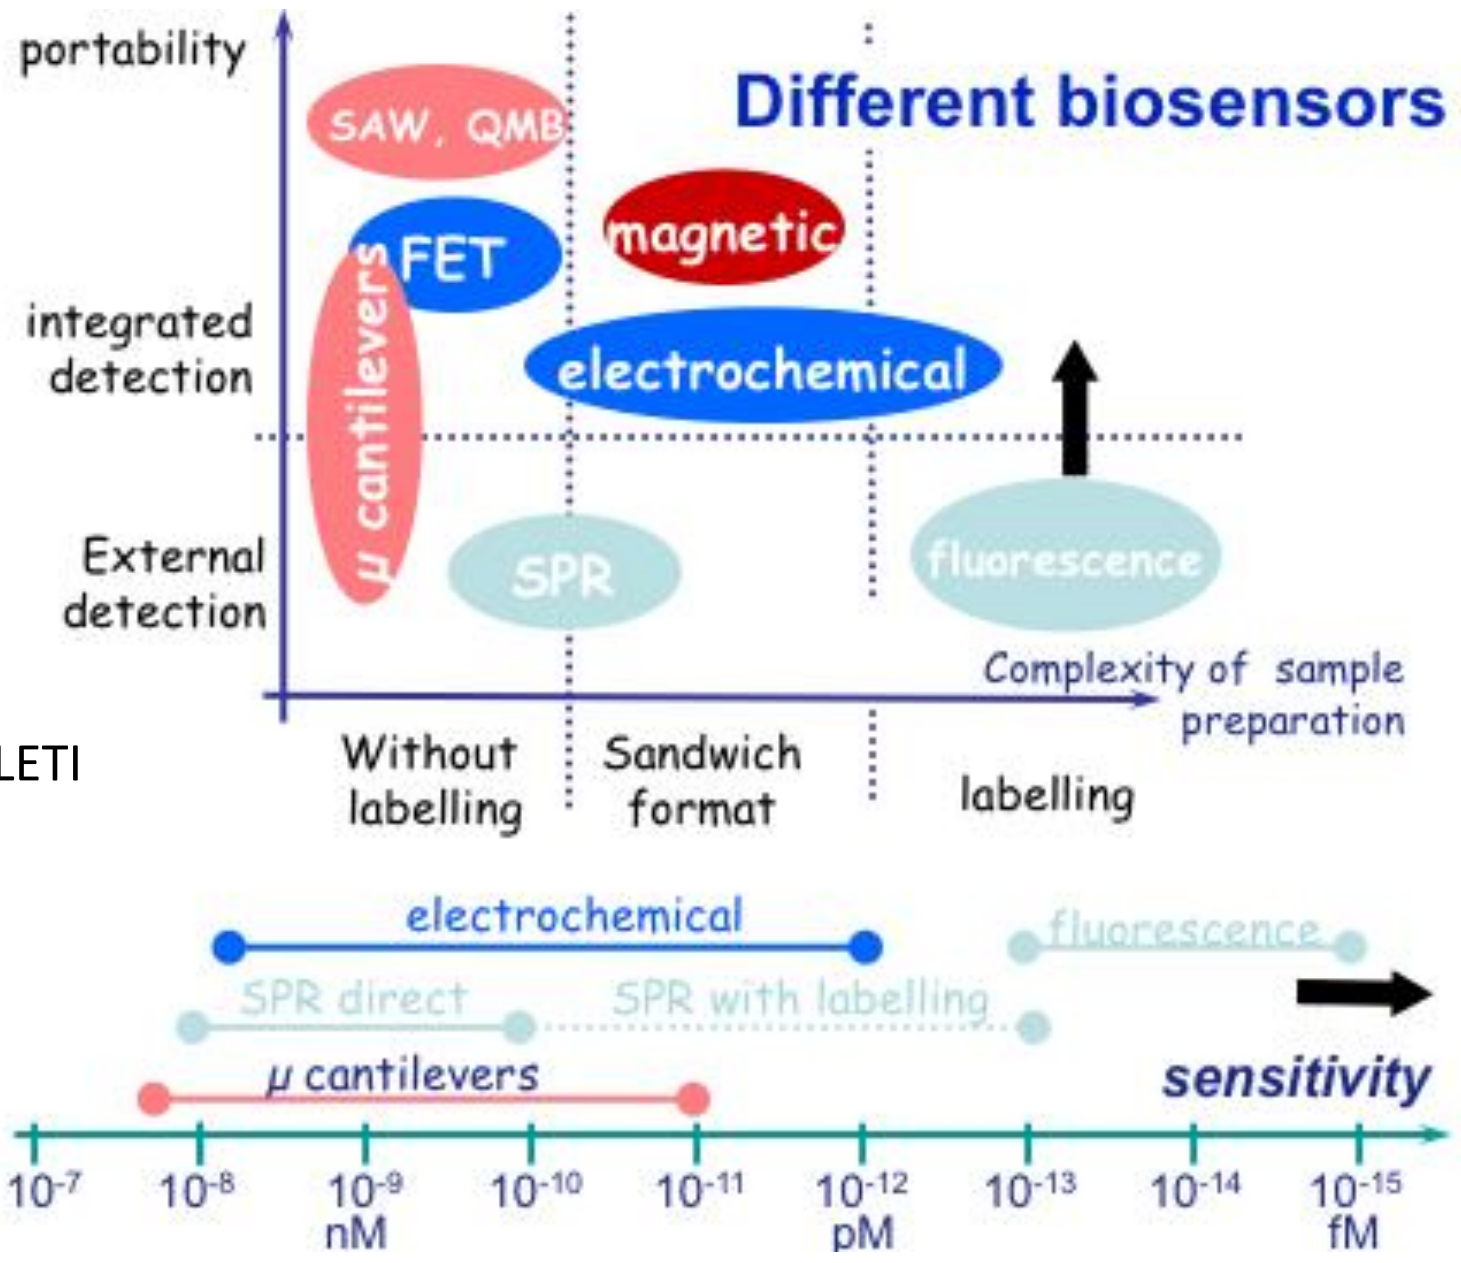

Pour diagnostic moléculaire, obstacles et limites physiques variées  
(liste non exhaustive):

Fonctionnalisation surface/Rendement d'extraction acides nucléiques/  
Purification/inhibiteurs de PCR/Rendement d'hybridation/Rendement de  
fluorescence/Adsorption non spécifique/Limite de détection/Multiplexage de  
la PCR- design des amorces/Multiplexage de l'hybridation- sondes pour bonnes  
sensibilité et spécificité...

Complexité: une seule personne ne connaît pas l'ensemble des points critiques

Conditions nécessaires (et pas suffisantes): réactivité, adaptabilité, travail en  
équipe avec boucles réaction rapides, compétences techniques, designs  
multiples continus; capacité à se remettre en cause.

# Supplément: Différents principes de détection d'hybridation

D'après CEA LETI
